**WHAT IS AVR?**

Automatic Voltage Regulation (AVR) technology increases "load" or decreases "light" voltage to a safe 230 to 250 volts. The Universal drops below 187 volts or exceeds 264 volts.

AVR protects your computer from damage and lost data. It restores incoming electricity and monitors out-voltage and over-voltage conditions, restoring delivery of only safe, "clean" electricity (220-230 volts). A wide spike — are corrected by AVR line safe electrically for your computer.

Unlike a surge protector alone, the Universal UPS with AVR provides a complete power protection solution that safeguards your computer's data and safety power off. In addition, the unit's "low-voltage" mode switches your computer to battery backup power and gives you time to save open files and safely power off. In addition, the unit's "low-voltage" mode switches your computer to battery backup power and gives you time to save open files, lighting and other common electrical appliances that can cause damage to your data or equipment.
