SOHO Series USB KVM (F1DS102U, F1DS104U)

To update the firmware you will need the following items:

- a. A separate computer running Windows 98 or above.
This computer must not be connected to the CPU ports on the KVM.
- b. An available parallel port on the computer
- c. Custom Flash Cable (*DB25-male to RJ45; included with purchase*) that connects between the KVM switch and the computer.
- d. 9V DC 1A Power Supply (*included with purchase*)
- e. Firmware update file.

To update firmware:

1. Remove **ALL** computers from the switch
2. Connect the custom Flash Cable to the parallel port on the PC and to the RJ45 connector labeled "Flash Upgrade" located on the top panel of the KVM Switch.
3. Connect the power supply (*additionally you may connect a keyboard to the console of the switch to prevent it from beeping.*)
4. Download the firmware file with the extension name "exe"
5. Save the firmware file to your desktop
- 6 Double-click to open the firmware file with the "exe" extension.
- 7 Click on Flash

Once the update is complete you will see a dialog box that says, *update successful*. You may now remove the flash cable and Power Supply. This will cause the unit to reset. Reconnect the power adapter, and connect your computers to the switch.
